What if I have an accident?

If you have an accident, even if you feel it is not your fault, test your blood glucose level to demonstrate whether or not you were hypo. If you have a hypo while driving, you may be charged with driving under the influence of a drug (insulin or diabetes tablet), driving without due care and attention, or dangerous driving. If you have a hypo at the wheel, you must inform the DVLA as soon as you can.

Safe driving

- Keep hypo treatments in the car at all times.
- If you inject insulin, check your blood glucose no longer than 2 hours before driving and then every 2 hours on long journeys. You may need to do this if you take tablets that may cause hypos. Group 2 drivers (bus/lorry) on a sulphonylurea or glinide are required by law to monitor their blood glucose level at least twice daily and at times relevant to driving.1,2
- Do not drive if your blood glucose is less than 5 mmol/L. If your reading is between 4 and 5 mmol/L, eat a small starchy snack like 2 plain biscuits or a piece of fruit. If your blood glucose is less than 4 mmol/L, treat the hypo and do not drive for at least 45 minutes after you have recovered.

If you have a hypo while driving, stop the car as soon as possible. Remove the keys to demonstrate you are not in charge of the car, and move into the passenger seat if safe to do so. Treat the hypo as advised. You should not drive for at least 45 minutes after recovery because your response rate will be slower.

Remember ...

- Having a hypo means that your blood glucose level is too low (less than 4 mmol/L).
- Act IMMEDIATELY by eating or drinking something that will raise your blood glucose quickly.
- Never ignore the warning signs.
- Make sure other people know what to do when you are having a hypo.
- Always carry glucose, a blood glucose meter and diabetes identification.

Having diabetes does not mean that you have to give up driving...

**Do I need to notify the DVLA?**

You can be fined up to £1,000 if you don’t tell the DVLA about a medical condition that affects your driving. You may be prosecuted if you’re involved in an accident as a result.

The following information assumes there are no other circumstances that affect your ability to drive safely, particularly regarding your risk of, and your ability to detect hypos. If you are unsure which category your diabetes medication is in, ask your pharmacist or your diabetes healthcare professional.

**Other circumstances**

Your ability to recognise and treat hypos, and the development of diabetes complications, may affect your ability to drive safely. By law, you must inform the DVLA when the following affect you (even if you are only taking medications that fall in the “NO” box mentioned previously):

- You need laser treatment to both eyes, or in the remaining eye if you have sight in one eye only.
- You are unable to read (with glasses or contact lenses if necessary) a car number plate at 20 metres (65 feet).
- You have problems with the circulation or sensation in your legs that means you have to drive automatic vehicles or vehicles with a hand-operated accelerator or brake.
- An existing medical condition gets worse or you develop any other condition that may affect you driving safely.

**Nb. It is advisable to inform your motor insurance company if you have diabetes to avoid any problems should an accident occur.**

**The law: Your responsibilities**

If you are on a diabetes medication that requires you to inform the DVLA, it is your responsibility to do so – your driving insurance will be invalid if you do not. Your diabetes treatments and circumstances may change over time, so check if this affects your ability to drive and whether you need to contact the DVLA.

For car or motorcycle 1-, 2-, or 3-year licences (Group 1), you must meet the following criteria and you must notify the DVLA:
- You have adequate awareness of hypoglycaemia.
- No more than one episode of severe hypoglycaemia in the preceding 12 months.
- Appropriate blood glucose monitoring.
- You are not regarded as a likely risk to the public while driving.
- You meet the visual standards for acuity and visual field.

You will have to sign to say you will comply with healthcare professionals’ instructions and report any change in your condition to the DVLA.

For bus and lorry (Group 2) 1-year licences (which require annual review), you must meet the following criteria:
- You have full awareness of hypoglycaemia.
- No episode of severe hypoglycaemia in the preceding 12 months.
- You must use a blood glucose meter with sufficient memory to store 3 months of readings.
- You can demonstrate an understanding of hypoglycaemia risk.
- You have no disqualifying complications of diabetes, such as problems to your sight.

Hypoglycaemic episodes (“hypos”) are when your blood glucose levels are too low, which can lead to confusion and affect your ability to drive. This can increase the risk of accidents, which bars some people from driving. Having diabetes does not mean that you have to give up driving, but it does mean that you need to plan in advance before you get behind the wheel. Complications associated with diabetes can affect your ability to drive, as well as your risk and awareness of hypos.
